

Following is a high level product requirement:

- This should be a website
- People should be able to create a user with login creds
- Once login is successful, the homepage should have option to view(retrieve)/create a new expense sheet/update (existing)/create a new sheet by uploading google sheet with a specific formatted fields
- In the create a new expense sheet following are the fields to capture
 - Identify the number of persons and name of the persons with whom the expense will be split along with email/phone number - the capability should be like CRUD operation - should be able to create/update/delete/read
 - Expense sheet
 - Should have title of the expense
 - Total amount of the transaction
 - Paid by whom (should be a drop down from the list of people entered for the expense captured above)
 - In the split section, the capability should be do the following:
 - Show all the initials of the people in the expense as radio button/circles/buttons that the person should be able to select to perform either of the functionality
 - If all the people names are selected - Should be equally split
 - If few people selected
 - should be either equally split
 - Should be split in percentage format (allow the person to chose what is the percentage)
 - Once this split is done, should be able to save the transaction
- This way the person should be able to save all the transactions for a given expense sheet
- Once all the transactions are captured, the capability should show how much is the total expense and who has to pay whom and how much.
- Should be able to send the sheet as PDF/sheet to email or whatsapp or other preferred social media
- Should also be providing an option to integrate with free money transfer capabilities like stripe to enable the transfer immediately.

Based on the above requirements - come up with

- Create a team in a box with 4 developers (who write the code), 1 tech lead (who does code review) and the product owner looking into the product requirements. Give the virtual names to each agent.
- refined Product requirement document
- Tech design document
- Architecture document
- Work drivers needed
- Create all the Jira issues needed for the above in Jira link shared. Document acceptance criteria along with Gherkin scripts
- Have all the 4 developers on the team to start picking up the tasks and write the code locally.
- Once the code is written, write unit tests and do an integration test.
